

More about the inside of a Neutral Zone inside of a Black-Hole

The idea for Neutral Zone unique to the C-R theory.

The Neutral Zone is the total volume inside the Black-Hole where the escape velocity (or gravitational curvature) exceeds the speed-of-light. Effectively, this prevents any interactions, knowledge, influence, or time-related events while in the Neutral Zone. Everything which comes into the Neutral Zone comes in at it's minimum possible energy configuration, including photons and neutrinos.

Note: By it's very nature, the Neutral Zone accumulates and concentrates both matter (charged and neutral), and energy (time-frozen, or energy-resonant but trapped).

Matter acts like it is caught "sleeping" in a hammock, but each piece tied-up so it can't get out. Imagine the same idea for a photon of energy. Each photon would act like it was trapped - resonating inside a reflective billiard ball. At this time, it can't decay, interact, influence, radiate, or escape. Neither do they disappear, or travel to somewhere or somewhen else.

Note: either this volume of spacetime doesn't obey the second law of thermodynamics, or the second law doesn't apply here. (Is it really a law then?)

Ironically, for matter and energy trapped in the Neutral Zone, any motion by matter or energy in either the outside Active Zone, or the inside Active zone will be "relatively" at faster-than-the speed-of-light!! For theoreticians,

does this imply a practical way to circumvent the speed-of-light limit we face?

If we can do it once, nature almost implies it can be done again.

Neutral Zone

Interactions Forbidden

Once a particle was trapped in the Neutral Zone, over time there is a build-up of both excess positive charges and concentrated energy. The Neutral Zone is "primed" for reactivation. All it needs is some outside event sufficiently distort a part of the Neutral Zone's envelope to uncurve or unbend, and allow some or all of these particles to attain reactivation.
